

THERE IS NO BETTER SMOKE ALARM FOR ELECTRICIANS

And this is why.....

SPLIT SPECTRUM TECHNOLOGY

GT High Performance smoke alarms incorporate our unique split spectrum technology with not one – but two smoke sensors. A traditional photoelectric sensor and a second blue LED sensor to detect different particle sizes in the air.

These two sensors are capable of recognising the difference between smoke, dust and vapour. The combination of sensors means the alarm is better able to reduce false alarms that were previously caused by things like steam, dust and humidity.

GT High Performance smoke alarms are designed to be conservative in their dismissal of an alarm. This ensures the alarm does trigger when needed. GT alarms reduce the difficulties caused by false alarms whilst maintaining high accuracy.

Field testing has shown that the GT split spectrum technology can reduce false alarms from vapour and dust by 99%.

REMOTE SILENCING

GT High Performance smoke alarms contain an infrared sensor which allows the alarm to be instantly silenced by any existing IR remote control in the home.

Within 12 minutes of silencing the alarms and smoke density increases, the alarm sound will trigger again because the alarm will see that as an indication that it wasn't a false alarm. Silencing the alarms with a remote control does not disable the alarm – it is just muting the alarm and the alarm is still active.

With GT High Performance smoke alarms you have the split spectrum technology working to reduce unnecessary false alarms and a convenient way of silencing those alarms that do still occur in the form of remote silence.

When you burn the toast, silence the smoke alarms with your TV remote!

GT High Performance smoke alarms can be silenced with any existing remote control in your home.

GT smoke alarms are exactly what they say – high performance smoke alarms.

Every GT smoke alarm is backed by a lifetime warranty – the life of the smoke alarm.

LESS WORK, MORE PROFIT

GT High Performance smoke alarms are a game changer for electricians and compliance companies – dramatically reducing the number of maintenance requests and callbacks to deal with false alarming smoke alarms.

With split spectrum technology significantly reducing the number of false alarms and remote silencing allowing for simple silencing by anyone in the home you are no longer wasting your resources reattending properties.

The result is decreased workload, less work and higher profits through a significant productivity increase.
